# Partial filling of a capacitor (1)

$\sigma = Q / A$  : charge density

$E$  = electric field strength

$D$  = dielectric displacement

$\Delta V$  = potential difference

$C$  = capacitance

Available: Flat capacitor :  
= surface area  $A$  ,  
= distance of plates  $d$  ,  
= empty ( $\epsilon_r = 1$ ) .

Assume: initially, plates are charged with  $+Q$  ,  $-Q$ .

Question: What will happen with

$Q$  ,  $\sigma$  ,  $E$  ,  $D$  ,  $\Delta V$  and  $C$

upon **PARTIALLY** filling the capacitor with dielectric material (with  $\epsilon_r > 1$ ) ???

# Partial filling of a capacitor (2)

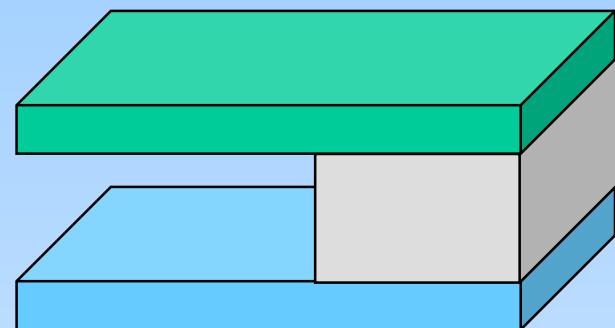

Options:

I. Free

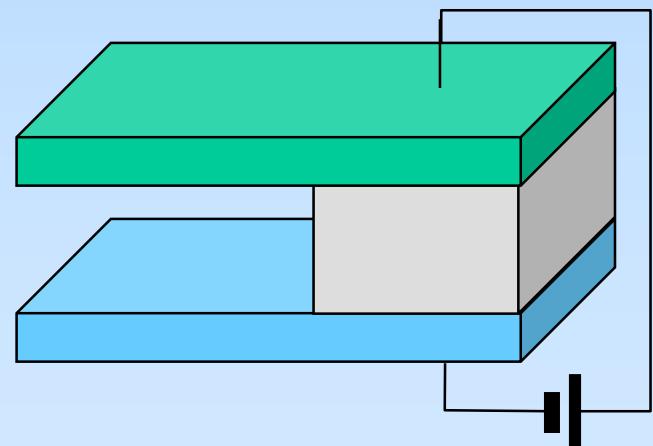

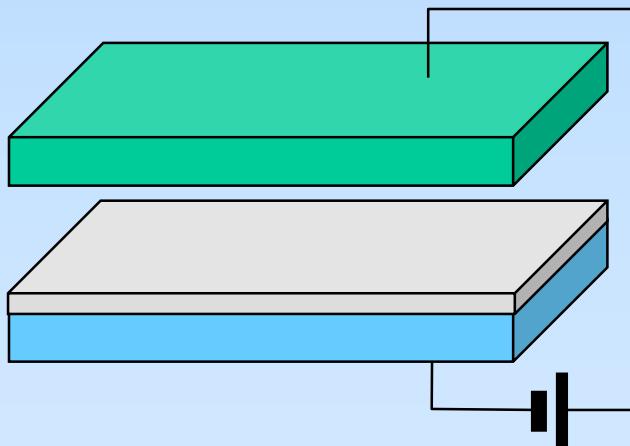

A. Series

B. Parallel

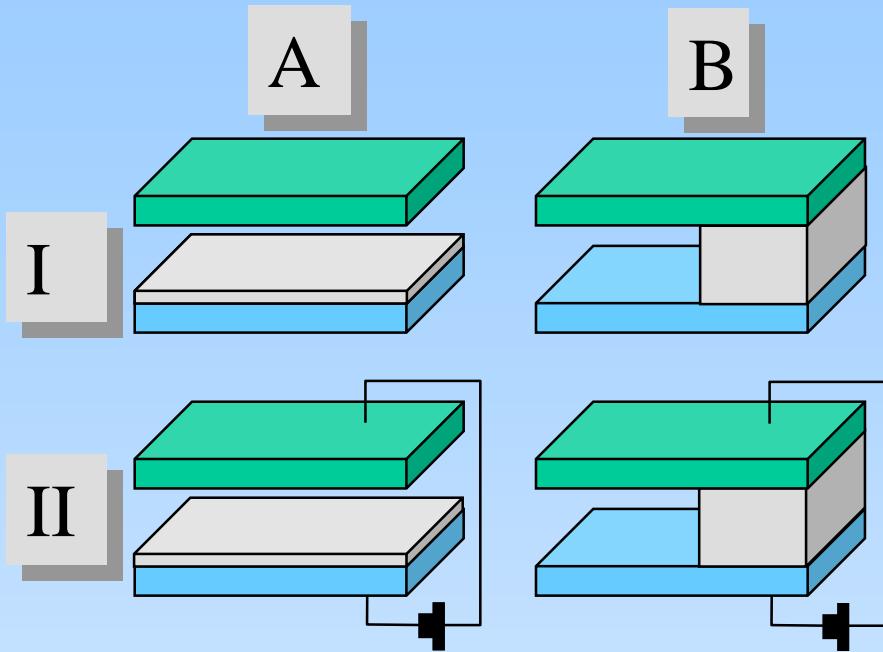

II. Connected  
to battery

Partly filling a capacitor with dielectric

# Partial filling of a capacitor (3)

Assume :

no “edge effects” :

$d \ll$  plate dimensions

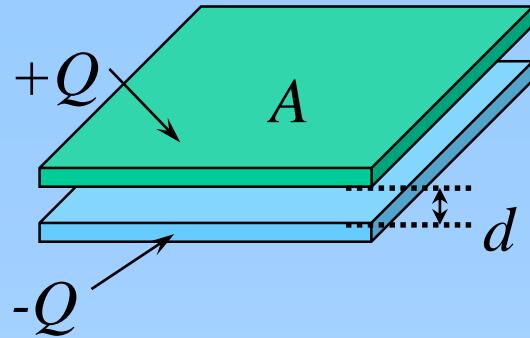

Consequences :

- no  $E$ -field leakage
- planar symmetry everywhere
- Gauss' Law is applicable
- straight field lines ( $E$  and  $D$ )

Suppose:

- when empty:  $Q_0$ ,  $V_0$  .... etc.
- when filled:  $Q'$ ,  $V'$  .... etc.
- filling for 1/3 of volume,
- with  $\epsilon_r = 5$

Partly filling a capacitor

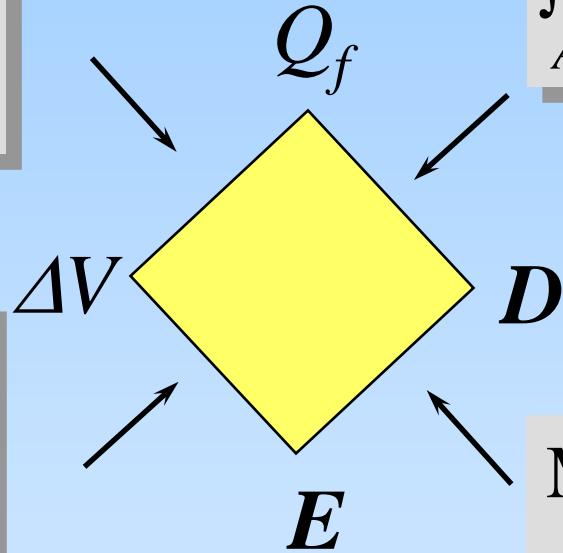

Capacitance:

$$C = Q_f / \Delta V$$

Potential:

$$\Delta V = \int_{path} E \bullet dl$$

$$\Delta V = E.d$$

# Relations for an ideal flat capacitor

Gauss:

$$\oint_A \mathbf{D} \bullet d\mathbf{A} = Q_f = \iiint_V \rho_f dV$$

$$Q_f = D \cdot A = \sigma_f \cdot A$$

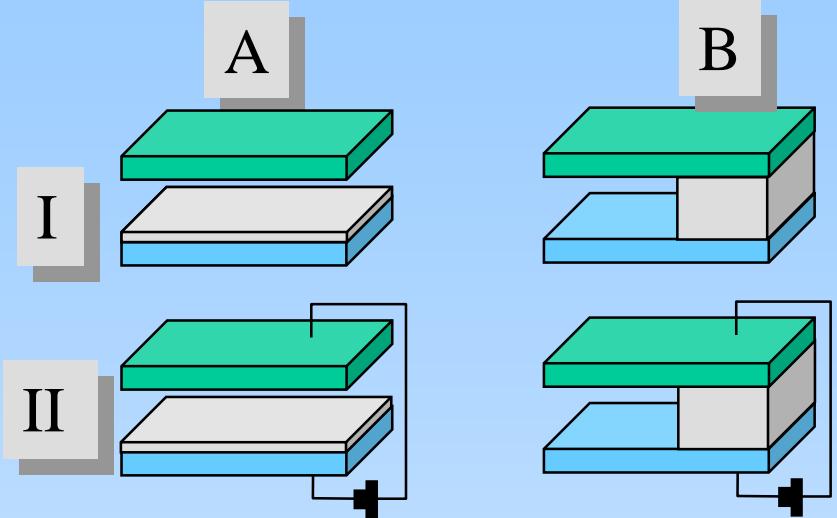

$Q_f$  = free charge

Material constants:

$$\mathbf{D} = \epsilon_0 \epsilon_r \mathbf{E}$$

$$\text{Capacitance: } C = \epsilon_0 \epsilon_r A/d$$

# What to expect ??

A.I and A.II:  
potentials in series

B.I and B.II:  
potentials parallel

$$\Delta V \quad \begin{array}{c} Q_f \\ \diamond \\ D \end{array} \quad E$$

$$Q_f = D \cdot A$$

$$D = \epsilon_0 \epsilon_r E$$

$$\Delta V = E \cdot d$$

$$C = Q_f / \Delta V$$

A.I and B.I: total charge unchanged

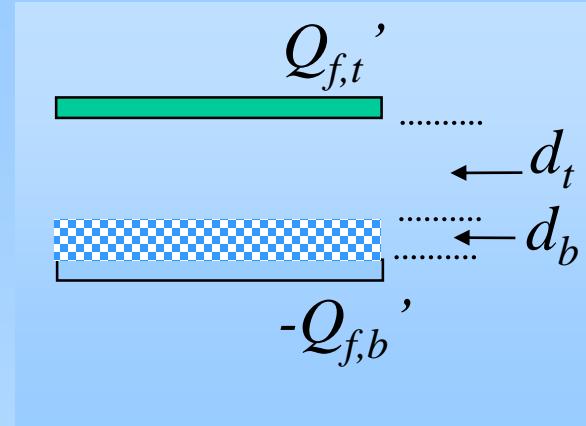

A.II and B.II: total potential unchanged

$$\text{I: } Q_f = \quad D = \quad \langle E \rangle \downarrow \quad \Delta V \downarrow \quad C \uparrow$$

$$\text{II: } \Delta V = \quad E = \quad \langle D \rangle \uparrow \quad \langle Q_f \rangle \uparrow \quad C \uparrow$$

$\langle \dots \rangle$  = average  
over both parts

# A.I. Horizontal filling, not connected

$d_b, d_t$ : bottom and top layer

Fill:  $d_b = d_0/3$  with  $\epsilon_r = 5$

$d_t = 2d_0/3$  with  $\epsilon_r = 1$

o = old (empty)

t = top      }

b = bottom      } total

$$\Delta V \quad \begin{array}{c} Q_f \\ \diamond \\ D \\ E \end{array}$$

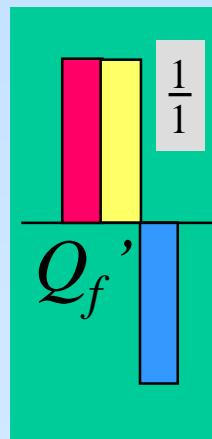

$$Q_f = D \cdot A \\ D = \epsilon_0 \epsilon_r E \\ \Delta V = E \cdot d \\ C = Q_f / \Delta V$$

Where to start ??

$Q_f$  remains constant

$$Q_{f,t}' = Q_{f,b}' = Q_0$$

$$\Delta V' = \Delta V'_t + \Delta V'_b \neq \Delta V_0$$

$D'$

$E'$

$d'$

$\Delta V'$

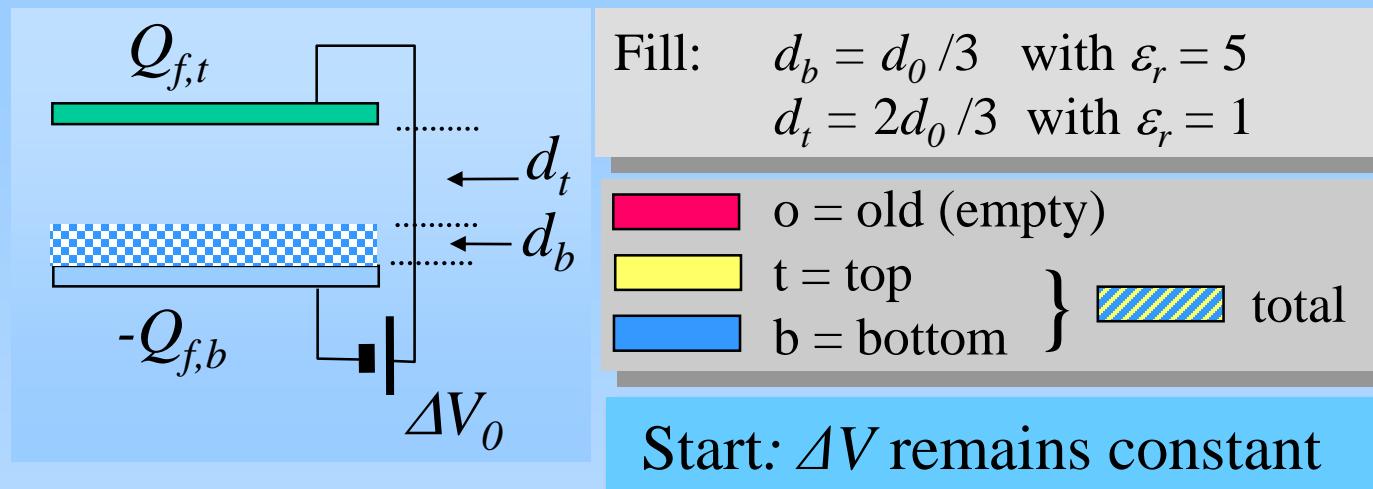

$\Delta V'$

$C'$

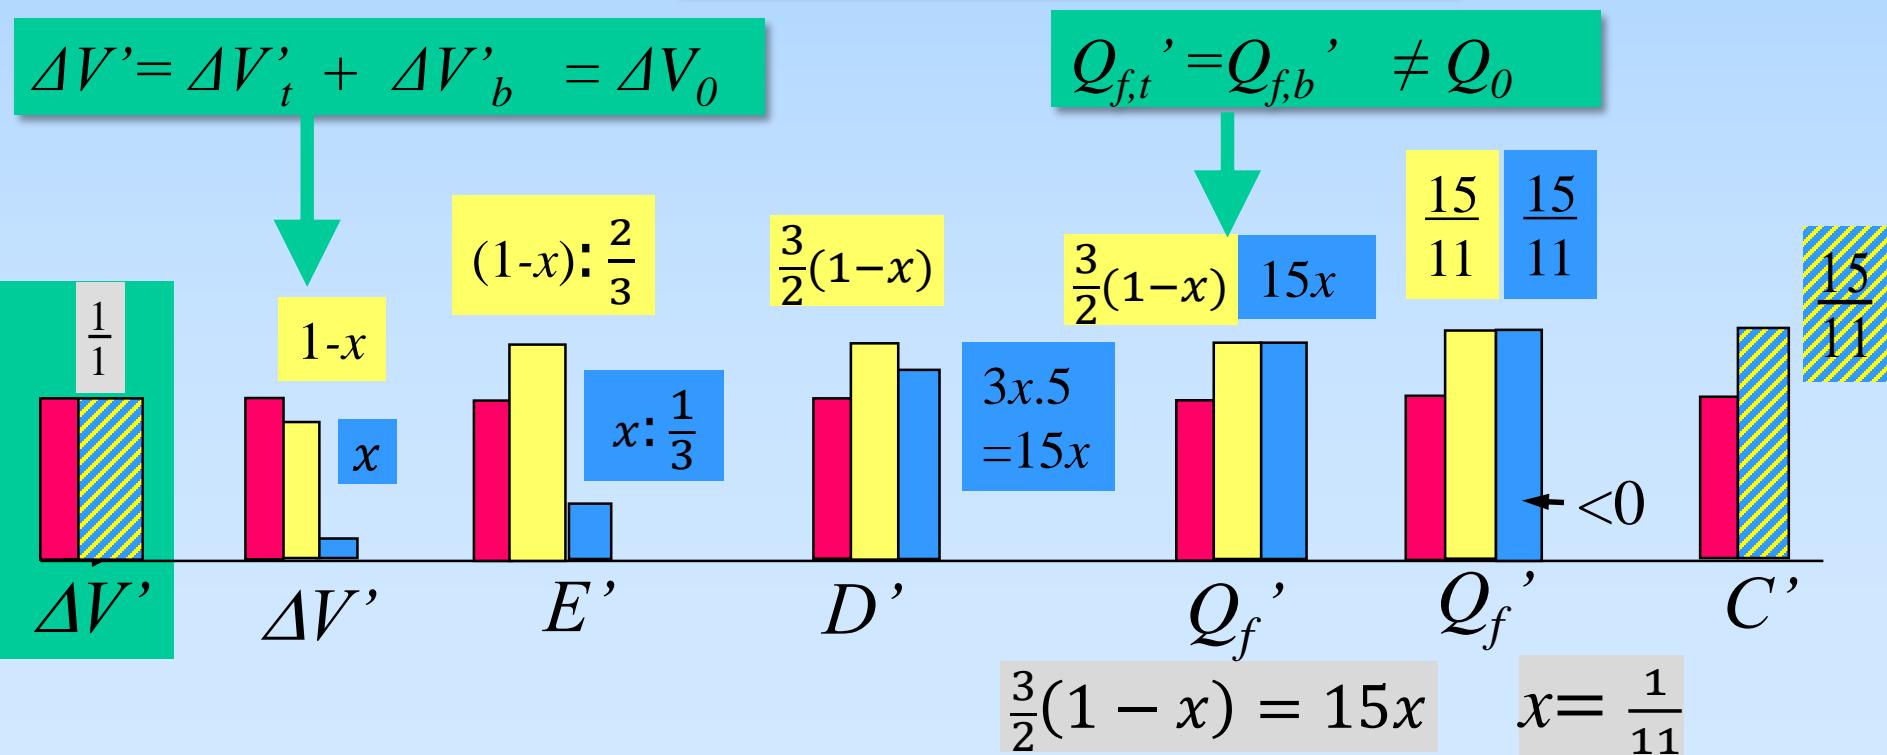

← Start

Partly filling a capacitor with dielectric

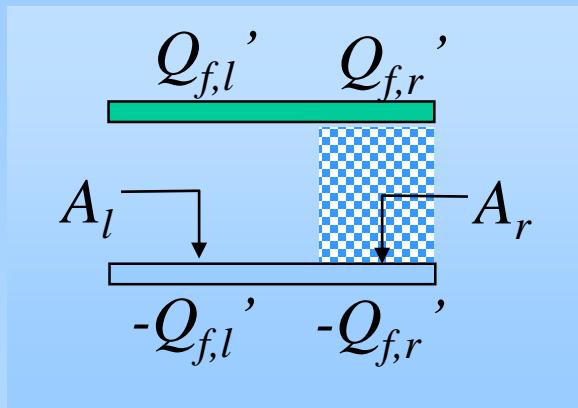

# A.II. Horizontal filling, connected

$$\begin{aligned} \Delta V &\diamond D \\ &E \\ Q_f &= D.A \\ D &= \varepsilon_0 \varepsilon_r E \\ \Delta V &= E.d \\ C &= Q_f / \Delta V \end{aligned}$$

# B.I. Vertical filling, not connected

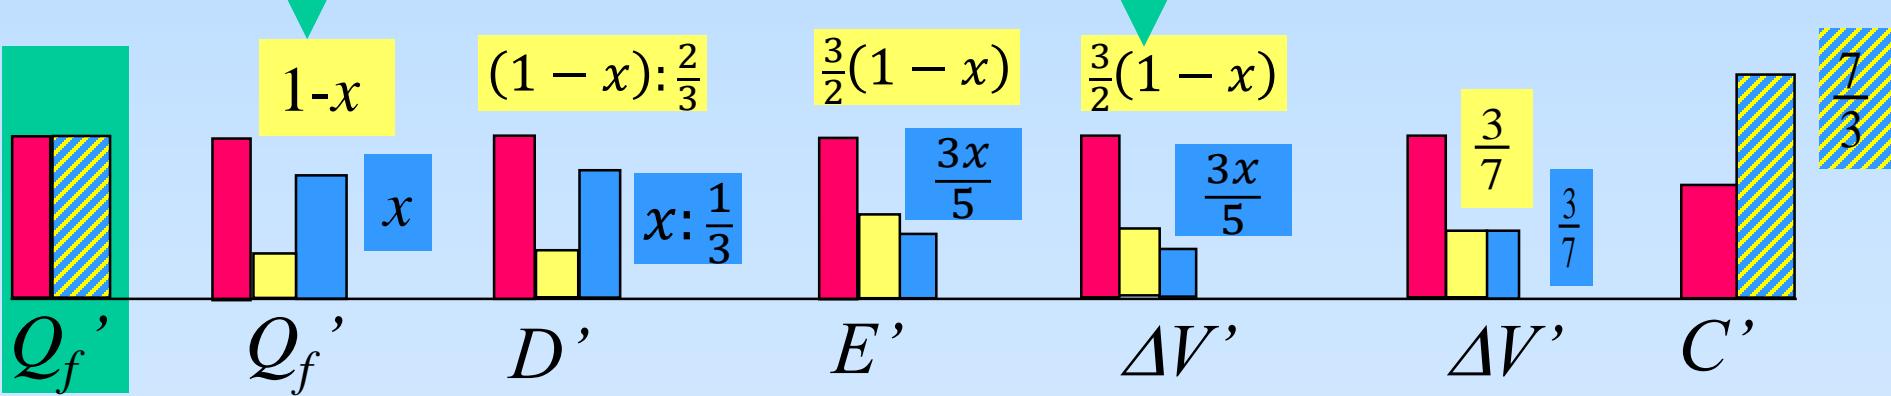

Fill: right:  $A_r = A_0/3$  with  $\varepsilon_r = 5$   
 left:  $A_l = 2A_0/3$  with  $\varepsilon_r = 1$

o = old (empty)  
 l = left      }  
 r = right      } total

Start:  $Q_f$  remains constant

$$Q_f' = Q_{f,l}' + Q_{f,r}' = Q_0$$

$$\Delta V_l' = \Delta V_r' \neq \Delta V_0$$

$$\frac{3}{2}(1-x) = \frac{3x}{5}$$

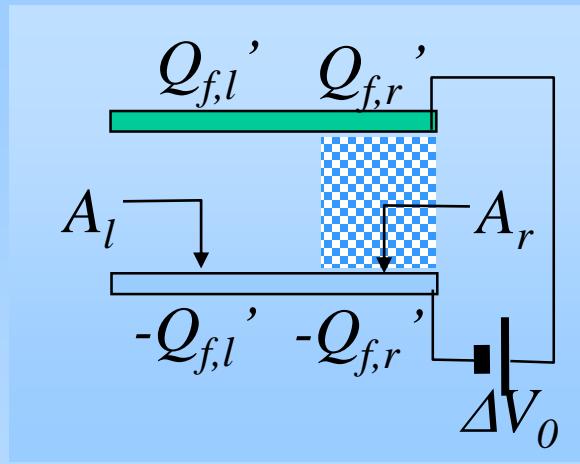

$$x = \frac{5}{7}$$

$$\frac{3x}{5} = \frac{3}{7}$$

$Q_f$   
 $\Delta V$   $D$   
 $E$

$Q_f = D \cdot A$   
 $D = \varepsilon_0 \varepsilon_r E$   
 $\Delta V = E \cdot d$   
 $C = Q_f / \Delta V$

# B.II. Vertical filling, connected

Fill:  $A_r = A_0/3$  with  $\varepsilon_r = 5$   
 $A_l = 2A_0/3$  with  $\varepsilon_r = 1$

o = old (empty)  
l = left      }  
r = right      } total

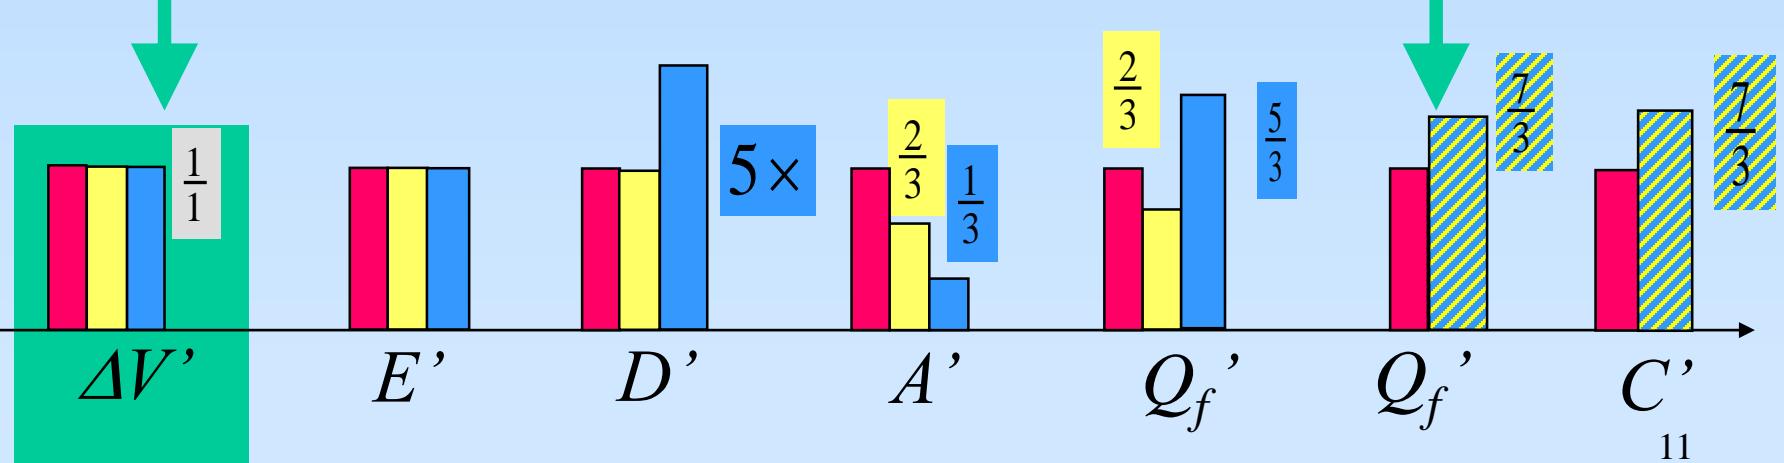

$Q_f$   
 $\Delta V$   $D$   
 $E$

$Q_f = D \cdot A$   
 $D = \varepsilon_0 \varepsilon_r E$   
 $\Delta V = E \cdot d$   
 $C = Q_f / \Delta V$

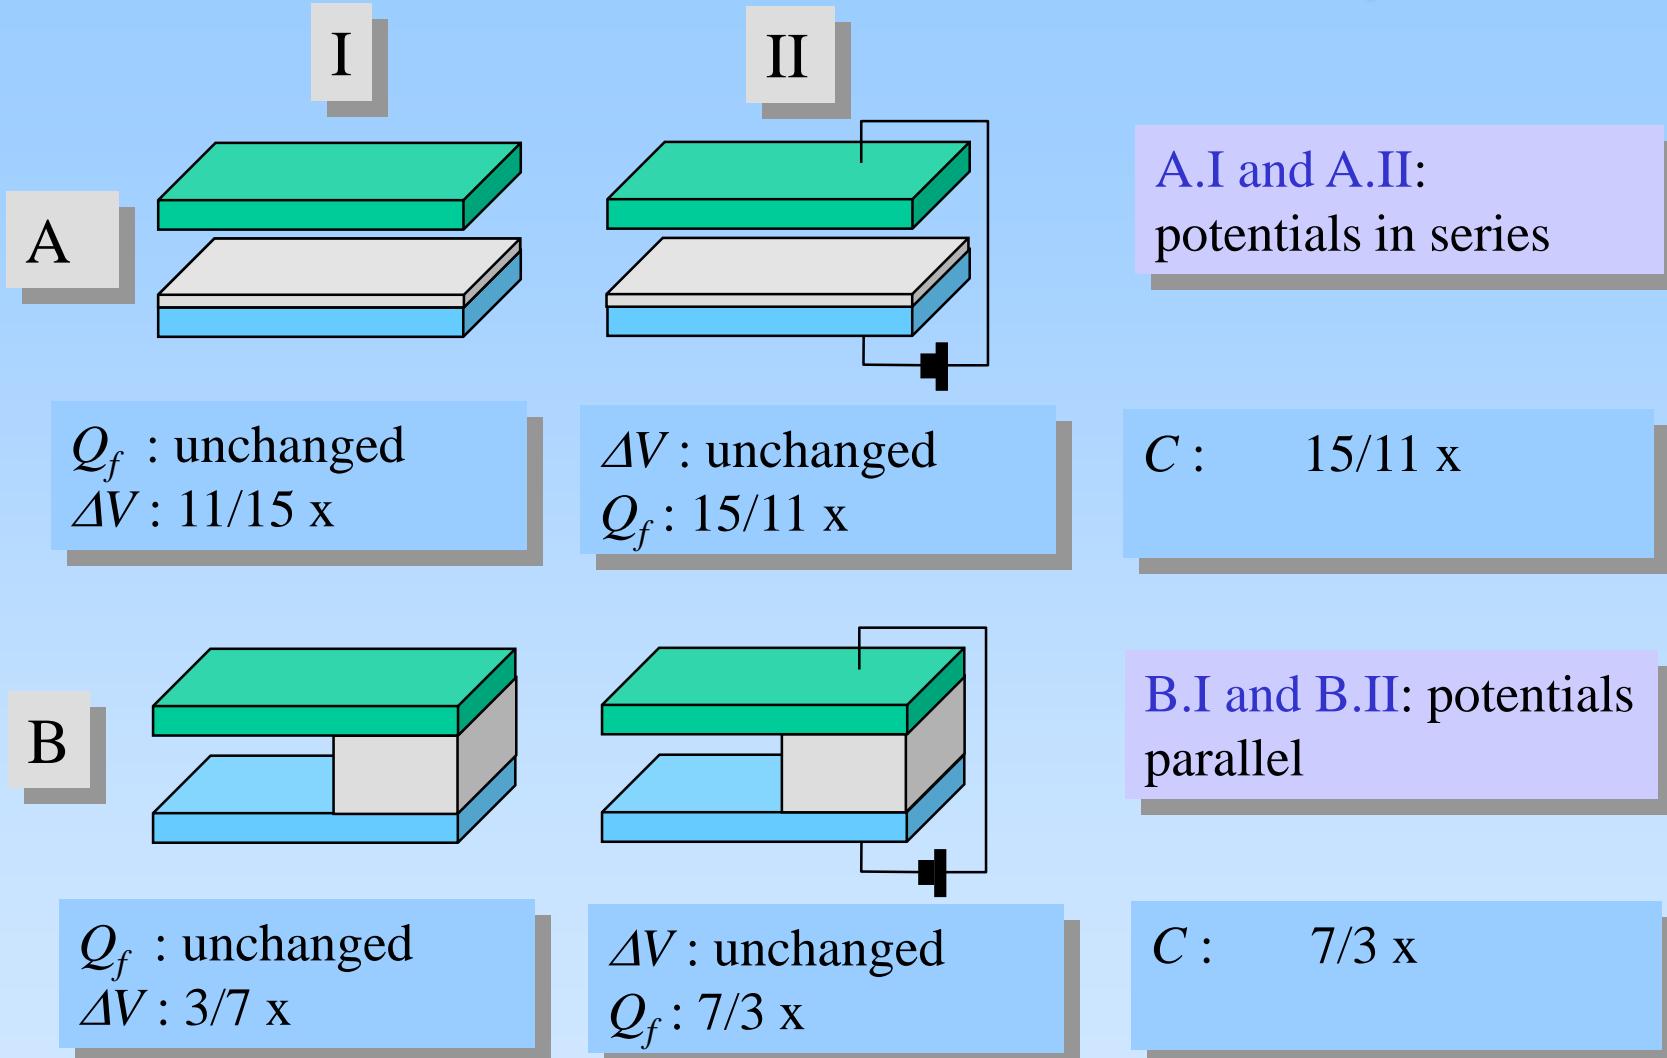

Start:  $\Delta V$  remains constant

$$\Delta V_l' = \Delta V_r' = \Delta V_0$$

$$Q_f' = Q_{f,l}' + Q_{f,r}' \neq Q_0$$

# Overview: 1/3 filled, $\epsilon_r = 5$

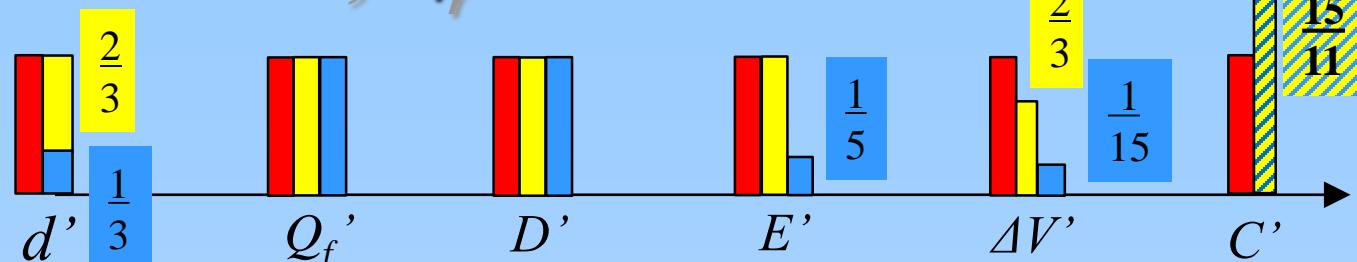

$C$  does not depend on how the capacitor is used (intrinsic property)

# Selftest: $1/3$ filled, $\varepsilon_r = 5$ :

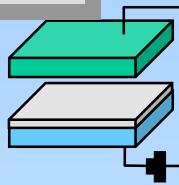

A.I

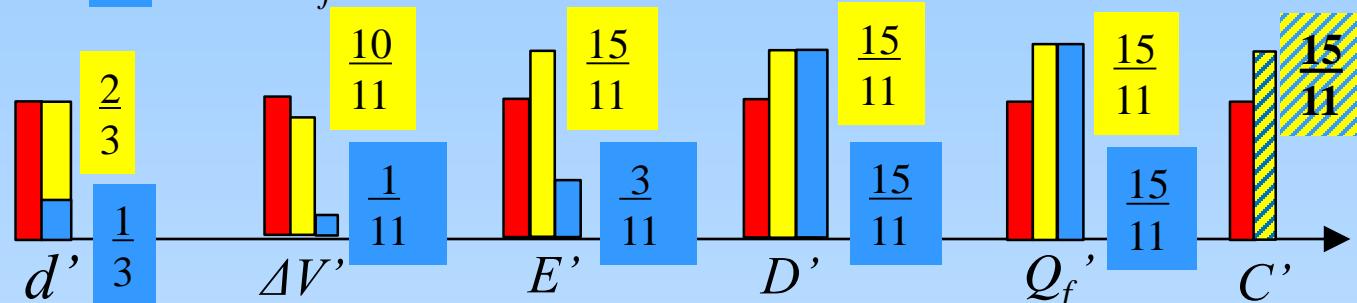

- old
- top
- bottom

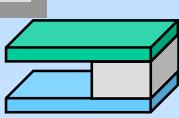

A.II

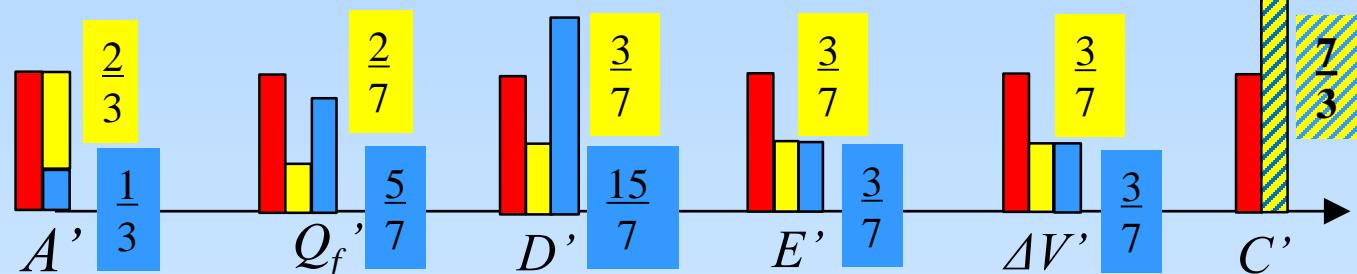

- old
- top
- bottom

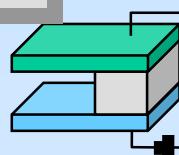

B.I

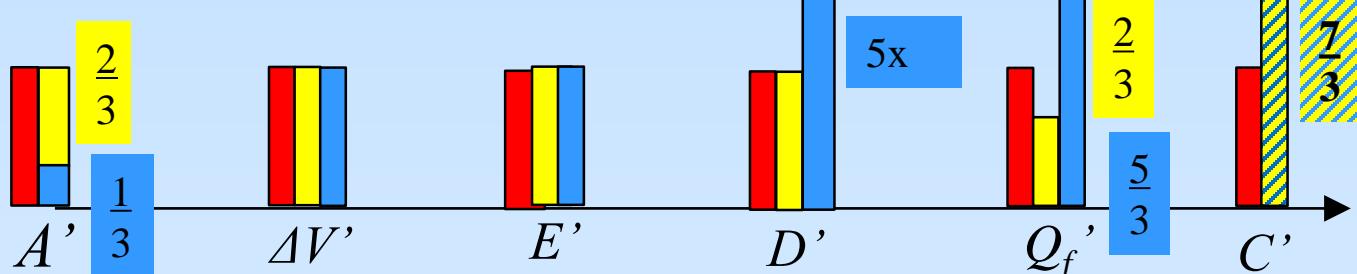

- old
- left
- right

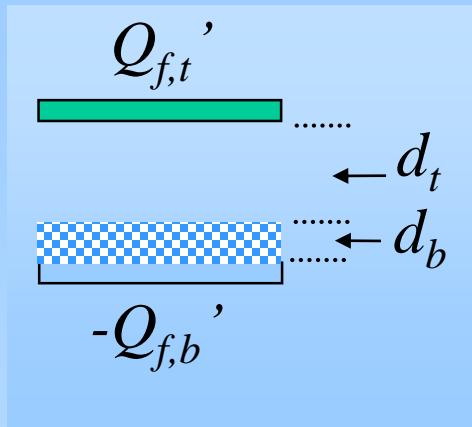

B.II

- old
- left
- right

# Dielectric polarization $P$ , for A.I.

$d_b, d_t$ : bottom and top layer  
 Fill:  $d_b = d_0/3$  with  $\epsilon_r = 5$   
 $d_t = 2d_0/3$  with  $\epsilon_r = 1$

o = old (empty)  
 t = top  
 b = bottom } total

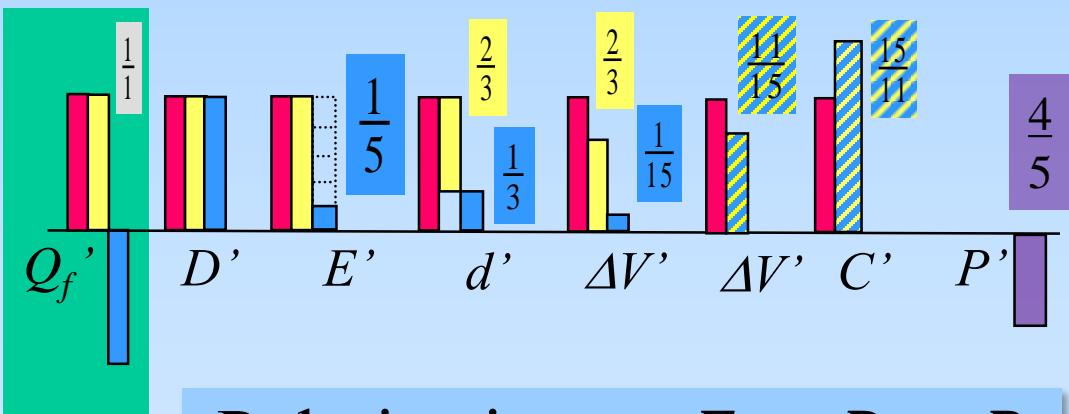

$$\Delta V \quad \begin{array}{c} D \\ \diamond \\ E \end{array}$$

$$Q_f = D.A$$

$$D = \epsilon_0 \epsilon_r E$$

$$\Delta V = E.d$$

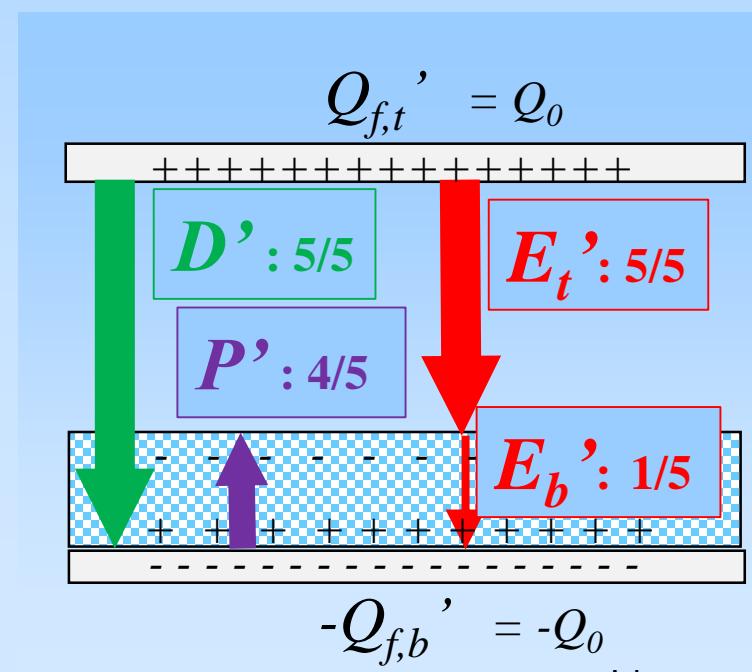

$$C = Q_f / \Delta V$$

Polarization:  $\epsilon_0 E = D - P$

$P = (\epsilon_r - 1) \epsilon_0 E = \chi_e \epsilon_0 E ; E = \text{total field}$

$\chi_e = \epsilon_r - 1 = \text{electric susceptibility}$

# Dielectric polarization $P$

Comparison with empty situation

$$Q_f = D \cdot A$$

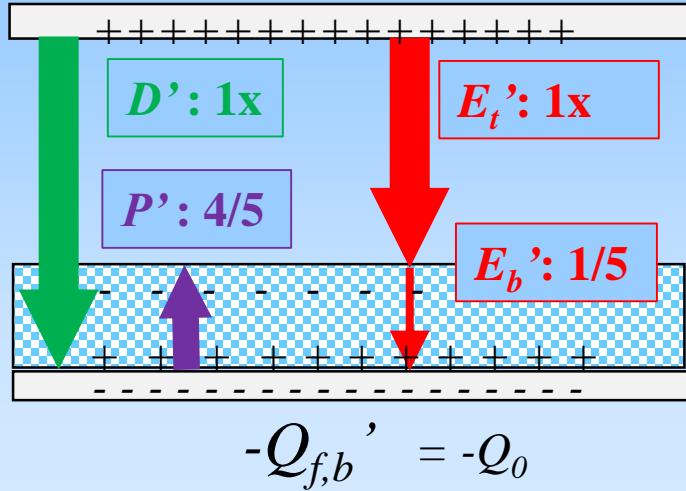

$$D = \epsilon_0 \epsilon_r E$$

$$\Delta V = E \cdot d$$

$$\epsilon_0 E = D - P$$

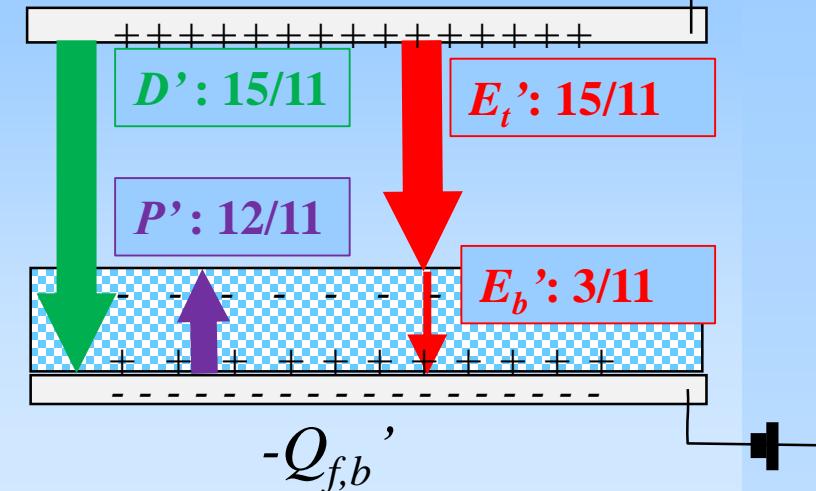

A.I

$$Q_{f,t}' = Q_0$$

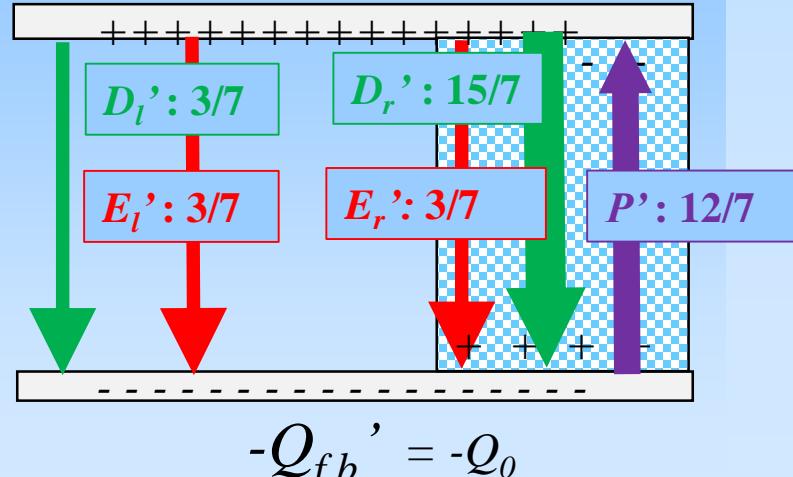

A.II

$$Q_{f,t}' = 15/11 Q_0$$

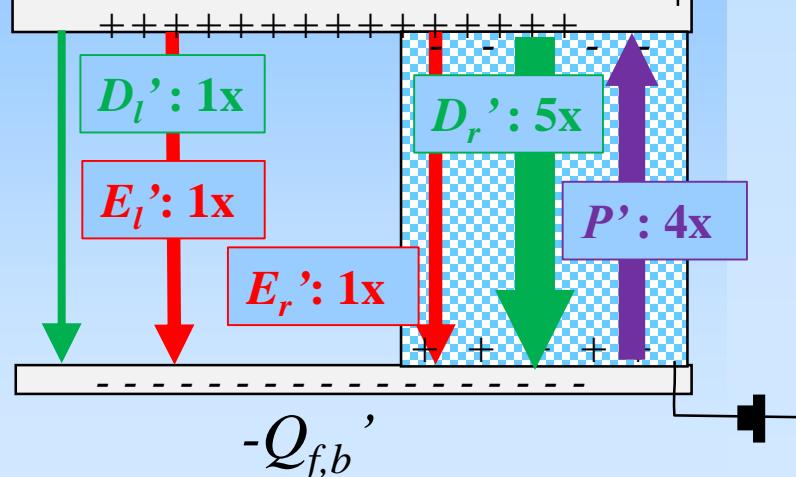

B.I

$$Q_{f,t}' = Q_0$$

B.II

$$Q_{f,t}' = 7/3 Q_0$$

# Homework 1

In the example, the capacitor was filled for 1/3 of the volume, with  $\varepsilon_r = 5$ .

Now suppose that the filling was:  
for a volume fraction  $p$ , with  $\varepsilon_r > 1$ .

Show that the capacitance changes with a factor  $F$ :

$$F = \left[ 1 - p + \frac{p}{\varepsilon_r} \right]^{-1}$$

for SERIES

$$F = 1 - p + \varepsilon_r \cdot p$$

for PARALLEL

Note: with  $\varepsilon_r > 1$ : for all  $p$  with  $0 \leq p \leq 1$  :  $1 \leq F(p) \leq \varepsilon_r$ .

# Homework 1

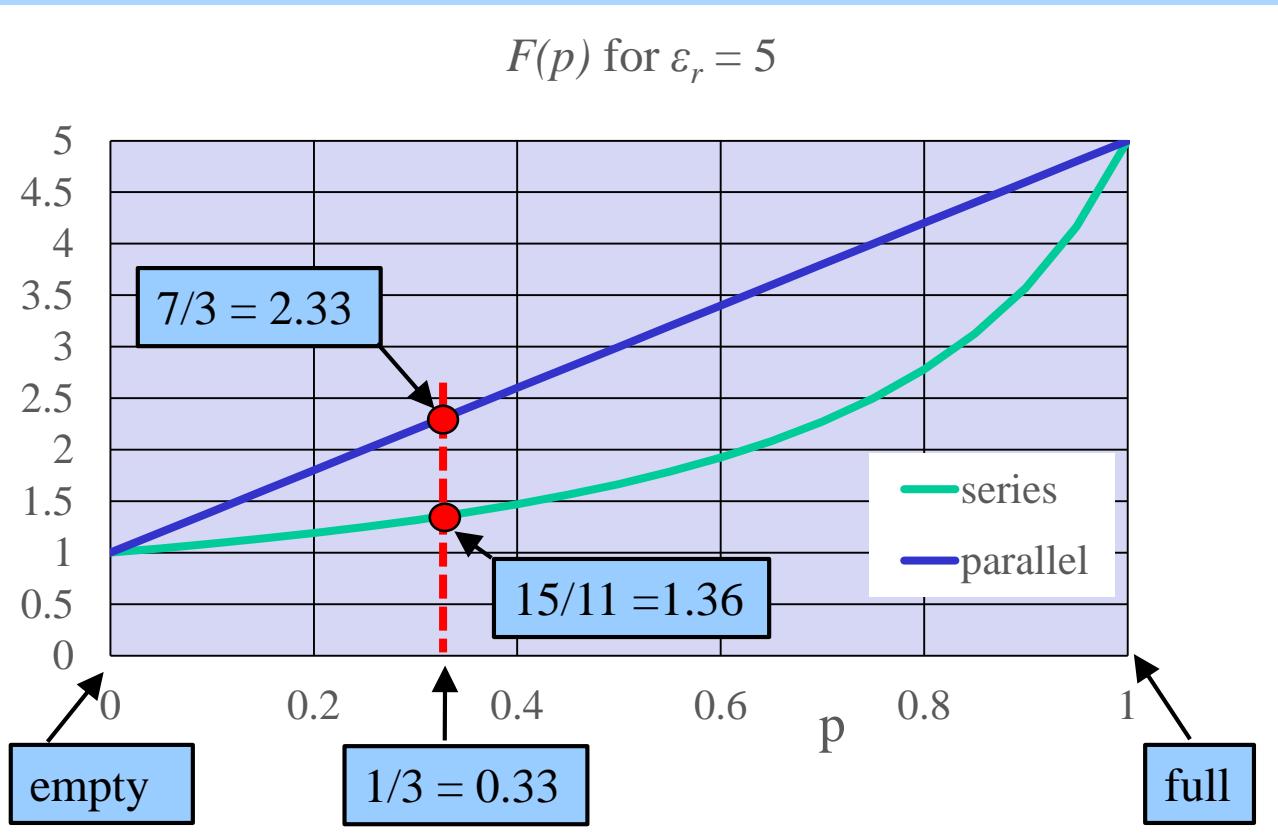

$$F = \left[ 1 - p + \frac{p}{\varepsilon_r} \right]^{-1}$$

for SERIES

$$F = 1 - p + \varepsilon_r \cdot p$$

for PARALLEL

Example:  
for  $p = 1/3$   
and  $\varepsilon_r = 5$  :  
  
series:  $F = 15/11$   
parallel:  $F = 7/3$

# Homework 2

In the example, the capacitor was filled for 1/3 of the volume, with  $\epsilon_r = 5$ .

Now suppose that the filling was: 2 dielectrics,  
- for volume fraction  $p$ , with  $\epsilon_{r1} > 1$ , and  
- for volume fraction  $1-p$ , with  $\epsilon_{r2} > 1$ .

Show that the capacitance changes with a factor  $F$ :

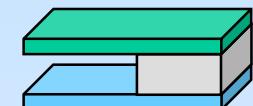

$$F = \frac{\epsilon_{r1}\epsilon_{r2}}{\epsilon_{r1}(1-p) + \epsilon_{r2}p}$$

for SERIES

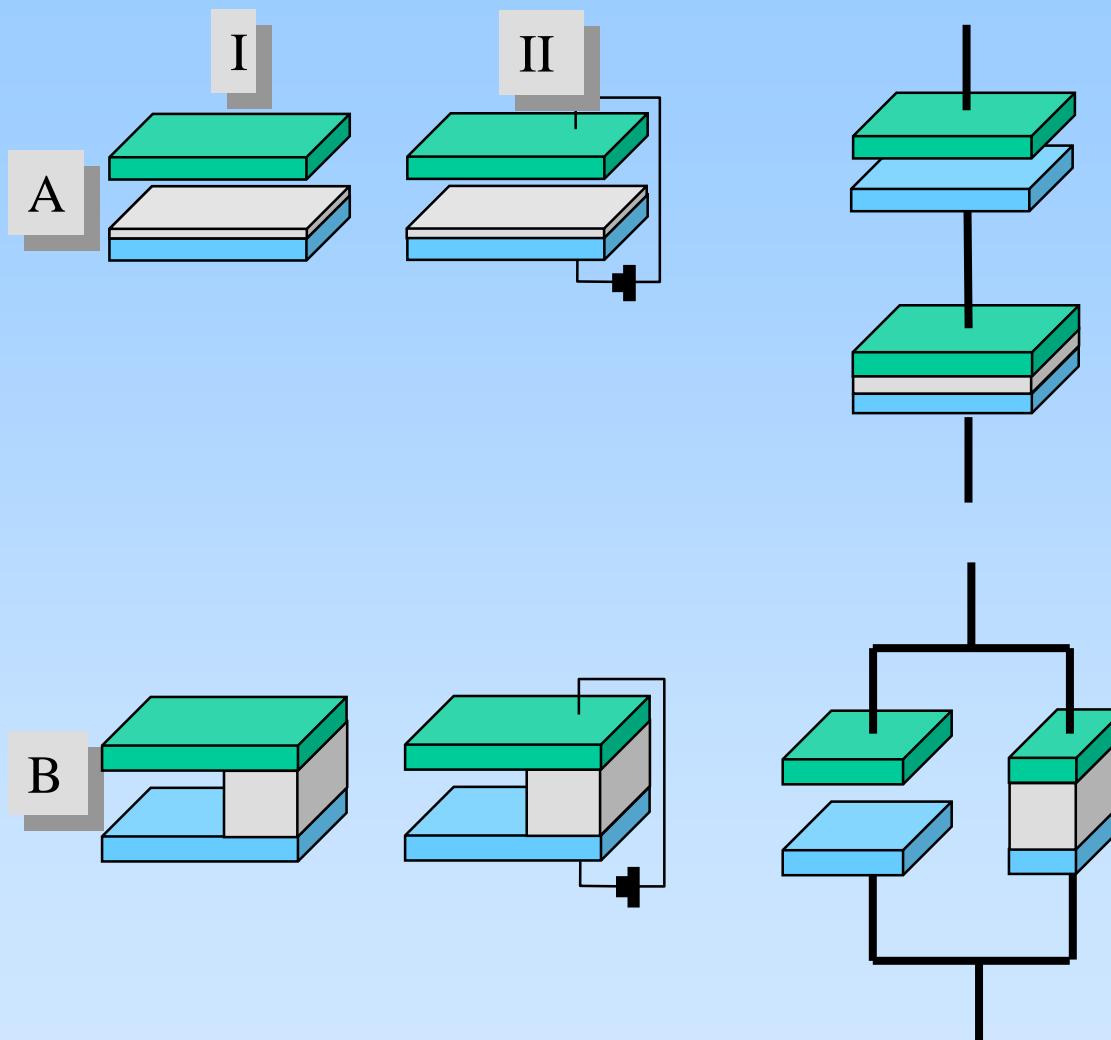

$$F = \epsilon_{r2}(1-p) + \epsilon_{r1} \cdot p$$

for PARALLEL

# Finally... Combination rules

A.I and A.II:  
series

$$\frac{1}{C'} = \frac{1}{C_t} + \frac{1}{C_b}$$

B.I and B.II:  
parallel

$$C' = C_l + C_r$$

the end
